

## CONTENTS

### **Chapter I. General introduction 7**

### **Chapter II. Methods 13**

Subjects **13**

Measurements **13**

Leg blood flow **13**

Microdialysis **14**

Drug infusions **15**

Western blot **16**

Measurements and analyses **16**

Calculations of hemodynamic parameters **17**

Cell culture **17**

Rat gluteus maximus skeletal muscle model for intravital microscopy **18**

### **Chapter III. Regulation of blood flow in resting and contracting skeletal muscle 20**

Introduction **20**

Vasoactive substances **21**

ATP **21**

Adenosine **23**

Nitric oxide **24**

Prostanoids **24**

Endothelin-1 **25**

Hypotheses and aims **27**

Regulation of skeletal muscle blood flow in the initial phase of exercise **29**

Regulation of skeletal muscle O<sub>2</sub> uptake in the initial phase of exercise **33**

Vasodilator interactions and implications for exercise hyperemia **35**

Mediators of adenosine-induced vasodilation **35**

Interstitial ATP induces vasodilation in skeletal muscle: implications for exercise hyperemia **38**

Mediators of ATP-induced vasodilation **41**

Vasoconstrictor effects of interstitial ATP **42**

Mechanisms important for vascular function and regulation of skeletal muscle blood in essential hypertension and aging and the effects of physical activity **43**

Vascular physiology and essential hypertension **43**

Adaptive responses to physical activity in hypertensive subjects **46**

Vascular physiology and aging **47**

Adaptive responses to physical activity in aging humans **52**

Limb-specific differences in vascular function and skeletal muscle blood flow regulation **56**

Assessment of the vascular response to acetylcholine and exercise as tools to evaluate endothelial and vascular function **57**

Muscarinic receptors and vasodilator response to acetylcholine **59**

**Summary and conclusion 61**

**Resumé 65**

**Perspectives 70**

**References 71**

**Articles I-VIII and supplemental article 100**
